## Comment

Please note: All fetal anomalies cannot be detected by ultrasound alone. The pick up rate of abnormalities depend on gestational age of the fetus, fetal position, maternal habitus, tissue penetration of ultrasound waves and machine resolution. The results of the today's scan have been discussed with the parents. They were aware that ultrasound examination alone cannot exclude all genetic syndromes or chromosomal abnormalities. This report is not for medicolegal purposes.

## Impression

There is a single viable intrauterine pregnancy.

The fetus is in cephalic presentation today .

Fetal growth, (EFW - 28 th centile )

Amniotic fluid (AFI - 12.4) is normal

Fetal Doppler and Uterine artery Doppler are normal.

Detailed structural evaluation of fetus not possible due to advanced gestation and fetal position. All abnormalities cannot be excluded by ultrasound alone. Some abnormalities evolve as gestational age advances.

I, Dr. Mythreyi. K declare that while conducting ultrasonography / image scanning on Mrs. Esha Agarwal I have neither detected nor disclosed the sex of her fetus to any body in any manner.

## Follow-up

Follow-up as clinically indicated
